

Amendments to the Claims

1. (original) A cash dispensing automated banking machine comprising:

at least one computer;

a cash dispenser in operative connection with the at least one computer, wherein the cash dispenser is operative to dispense cash responsive to the at least one computer;

at least one transaction function device in operative connection with the at least one computer, wherein the transaction function device includes a transaction function device opening which is operative to provide at least one of a dispensed item and a deposited item therethrough;

a frame, wherein the cash dispenser, at least one transaction function device, and at least one computer are in operative connection with the frame;

a fascia in operative connection with the frame, wherein the fascia includes at least one fascia opening therethrough, wherein the fascia is operative to move between a closed position and an open position relative the frame;

wherein responsive to moving the fascia from the open position to the closed position either the transaction function device is operative to move the transaction function device

opening relative to the frame and into alignment with a fascia opening or the fascia is operative to move the fascia opening relative to the fascia and into alignment with the transaction function device opening.

2. (original) The machine according to claim 1, wherein the transaction function device includes a fixed portion in rigid connection with the frame, wherein the transaction function device includes a movable portion in pivoting connection with the fixed portion, wherein the movable portion includes the transaction function device opening.

3. (currently amended) The machine according to claim 2 30, wherein the fascia includes at least one guide adjacent the fascia opening, wherein when the fascia moves between the opened and closed positions, the guide ~~is operative to contact~~ operatively engages the movable portion and urges the movable portion to move the transaction function device opening into alignment with the fascia opening.

4. (original) The machine according to claim 1, wherein the fascia includes a floating bezel, wherein the floating bezel includes at least one bezel opening therethrough, wherein the at least one bezel opening comprises at least one fascia opening, wherein the floating bezel is operative to move relative to the fascia in at least one direction to align a bezel opening with the transaction function device opening.

5. (currently amended) The machine according to claim 4 ~~31~~, wherein the floating bezel includes at least one guide adjacent the bezel opening, wherein the guide includes a surface which during movement of the fascia from the open position to the closed position is operative to contact a portion of the transaction function device and urge the floating bezel to move the bezel opening into alignment with the transaction function device opening.

6. (currently amended) The machine according to claim 5, wherein ~~the at least one transaction function device includes~~ the cash dispenser includes the transaction function device opening.

7. (original) The machine according to claim 3, wherein the at least one transaction function device includes a receipt printer.

8. (original) The machine according to claim 1, wherein the fascia includes a light indicator aperture adjacent the fascia opening, wherein the transaction function device includes at least one light source adjacent the transaction function device opening, wherein when the transaction function device opening is aligned with the fascia opening, the light source is visible through the light indicator aperture.

9. (original) The machine according to claim 8, wherein the light indicator aperture includes a transparent member, wherein the at least one light source includes at least one LED.

10. (currently amended) The machine according to claim 9 32, wherein the transparent member is operative to magnify ~~the~~ light emitted from the at least one LED.

11. (original) The machine according to claim 8, wherein the at least one computer is operative to cause the at least one light source to emit at least one light signal contemporaneously with the at least one computer causing the transaction function device to operate.

12. (original) A method comprising:

- a) urging a fascia of an automated banking machine to move from an open position to a closed position adjacent a frame of the automated banking machine, wherein the automated banking machine includes a cash dispenser, and
- b) responsive to (a), aligning a transaction function device opening in a transaction function device with a fascia opening through the fascia, including at least one of:
 - c) moving the location of the fascia opening relative to the fascia; and
 - d) moving the transaction function device opening relative to the frame.

13. (original) The method according to claim 12, wherein in (c) the fascia includes a floating bezel, wherein the floating bezel includes a bezel opening therethrough, wherein the bezel opening comprises the fascia opening, wherein responsive to (a), the floating bezel is operative to move relative the fascia in at least one direction to align the bezel opening with the transaction function device opening.

14. (currently amended) The method according to claim ~~13~~ 34, wherein the floating bezel includes at least one guide adjacent the bezel opening, wherein ~~in (c)~~ the guide includes a surface, wherein in (b) the surface operatively engages ~~which is operative to contact~~ a portion of the transaction function device and urges the floating bezel to move the bezel opening into alignment with the transaction function device opening.

15. (original) The method according to claim 12, wherein the transaction function device includes a movable portion and a fixed portion, wherein in (d) the movable portion is operative to move in at least two dimensions with respect to the fixed portion, wherein the movable portion includes the transaction function device opening.

16. (currently amended) The method according to claim ~~15~~ 35, wherein the fascia includes at least one guide adjacent the fascia opening, wherein ~~in (d)~~ the guide includes a surface ~~which is operative to contact~~ and wherein during at least a portion of (b) the surface operatively engages the movable portion of the transaction function device and urges the movable portion to move the transaction function device opening into alignment with the fascia opening.

17. (original) The method according to claim 12, wherein the fascia includes a light indicator aperture adjacent the fascia opening, wherein the transaction function device includes at least one light source adjacent the transaction function device opening, wherein in (b) when the transaction function device opening is aligned with the fascia opening, the at least one light source is visible through the light indicator aperture.

18. (original) The method according to claim 17, wherein in (b) the light indicator aperture includes a transparent member, wherein the at least one light source includes at least one LED.

19. (currently amended) The method according to claim ~~18~~ 36, wherein ~~in (b)~~ the transparent member when aligned with the at least one LED in (b) is operative to magnify ~~the~~ light emitted from the at least one LED.

20. (currently amended) The method according to claim 19, further comprising:

~~e) c)~~ causing with a computer in the machine, the transaction function device to operate.

21. (currently amended) The method according to claim 20, further comprising:

~~f) d)~~ ~~contemporaneously with (e)~~ during at least a portion of (c), causing with a computer in the machine, the at least one LED ~~light source~~ to emit a light signal.

22. (original) The method according to claim 12, wherein in (c) the transaction function device includes the cash dispenser.

23. (original) The method according to claim 12, wherein in (d) the transaction function device includes a receipt printer.

24. (original) A cash dispensing automated banking machine comprising:

a cash dispenser in operative connection with at least one computer;

at least one transaction function device, wherein a transaction function device includes a transaction function device opening which is operative to provide at least one of a dispensed item and a deposited item therethrough;

a frame, wherein the cash dispenser and at least one transaction function are in operative connection with the frame;

a fascia in operative connection with the frame, wherein the fascia includes at least one fascia opening therethrough, wherein at least one of the fascia and the transaction function device are operative to move between an adjacent position and a spaced apart position with respect to each other;

wherein responsive to at least one of the fascia and the transaction function device moving from the spaced part position to the adjacent position either the transaction function device is operative to move the transaction function device opening relative to the frame and into alignment with the fascia opening or the fascia is operative to move the fascia opening relative the fascia and into alignment with the transaction function device opening.

25. (original) The machine according to claim 24, wherein the transaction function device is operative to slide relative to the frame into a service position which is operative to place the fascia and the transaction function device in the spaced apart position.

26. (original) The machine according to claim 24, wherein the fascia is operative to move between an open and a closed position, wherein in the open position, the fascia is operative to place the fascia and the transaction function device in the spaced apart position, wherein in the closed position, the fascia is operative to place the fascia and the transaction function device in the adjacent position.

27. (original) The machine according to claim 24, wherein the transaction function device includes the cash dispenser.

28. (original) A method comprising:

- a) urging a transaction function device of an automated banking machine to move relative to a frame from a service position to a position adjacent a fascia of the machine, wherein the automated banking machine includes a cash dispenser, and
- b) responsive to (a), aligning an opening to the transaction function device with an opening through the fascia, including at least one of:
 - c) moving the location of the opening through the fascia relative to the fascia; and
 - d) moving the opening to the transaction function device relative to the frame.

29. (new) A cash dispensing automated banking machine comprising:

at least one frame;

a plurality of transaction function devices including a cash dispenser, wherein the plurality of transaction function devices are in supporting relation with the at least one frame, wherein at least one transaction function device includes a transaction function device opening which is operative to enable at least one of dispensed items and deposited items to pass therethrough;

a fascia movably mounted in supporting relation with the at least one frame, wherein the fascia includes a fascia opening therethrough, wherein the fascia is movable between a closed position and an open position relative the at least one frame, wherein responsive to movement of the fascia from the open position to the closed position, at least one of (i) the transaction function device opening pivots relative to the at least one frame into alignment with the fascia opening, and (ii) the fascia opening moves relative to the fascia into alignment with the transaction function device opening.

30. (new) A cash dispensing automated banking machine comprising:

a frame;

a plurality of transaction function devices including a cash dispenser, wherein a transaction function device includes a transaction function device opening which is operative to enable at least one of dispensed items and deposited items to pass therethrough, wherein the transaction function device includes a fixed portion in relatively fixed supporting relation with the frame, and wherein the transaction function device includes a movable portion in movable supporting pivotal relation with the fixed portion, wherein the movable portion includes the transaction function device opening;

a fascia movably mounted in supporting relation with the frame, wherein the fascia includes a fascia opening therethrough, wherein the fascia is movable between a closed

position and an open position relative the frame, wherein movement of the fascia from the open position to the closed position causes operative engagement between the fascia and the movable portion such that the transaction function device opening moves relative to the frame and into alignment with the fascia opening.

31. (new) A cash dispensing automated banking machine comprising:

a frame;

a plurality of transaction function devices including a cash dispenser, wherein each of the plurality of transaction function devices are in supporting relation with the frame, wherein at least one transaction function device includes a transaction function device opening which is operative to enable at least one of dispensed items and deposited items to pass therethrough;

a fascia movably mounted in supporting relation with the frame, wherein the fascia is movable between a closed position and an open position relative the frame, wherein the fascia includes a floating bezel which is movably mounted in supporting relation with the fascia, wherein the floating bezel includes at least one bezel opening therethrough, wherein movement of the fascia from the open position to the closed position causes the bezel opening to move in at least one direction relative to the fascia to align the bezel opening and the transaction function device opening.

32. (new) A cash dispensing automated banking machine comprising:

a frame;

a plurality of transaction function devices including a cash dispenser, wherein the plurality of transaction function devices are each in supporting relation with the frame, wherein at least one transaction function device includes a transaction function device opening which is operative to enable at least one of dispensed items and deposited items to pass therethrough, wherein a transaction function device including the transaction function device opening includes at least one LED adjacent the transaction function device opening;

a fascia movably mounted in supporting relation with the frame, wherein the fascia includes a fascia opening therethrough, wherein the fascia includes a light indicator aperture adjacent the fascia opening, wherein a transparent member extends in the light indicator aperture, wherein the fascia is movable between a closed position and an open position relative the frame, wherein responsive to movement of the fascia from the open position to the closed position, at least one of (i) the transaction function device opening moves relative to the frame and into alignment with a fascia opening and (ii) the fascia opening moves relative to the fascia and into alignment with the transaction function device opening, and wherein when the transaction function device opening is aligned with the fascia opening, the at least one LED is positioned adjacent the transparent member.

33. (new) A method comprising:

- a) moving a fascia of an automated banking machine from an open position to a closed position with respect to a frame of the automated banking machine, wherein the automated banking machine includes a plurality of transaction function devices including a cash dispenser, wherein at least one transaction function device includes a transaction function device opening, wherein the fascia includes a fascia opening therethrough and wherein the fascia opening is movable relative to the fascia; and
- b) aligning the transaction function device opening with the fascia opening, including, responsive to movement of the fascia in (a), at least one of:
 - i) urging the fascia opening to move relative to the fascia; and
 - ii) urging the transaction function device opening to pivot relative to the frame.

34. (new) A method comprising:

- a) moving a fascia of an automated banking machine from an open position to a closed position, wherein the automated banking machine includes a plurality of

transaction function devices including a cash dispenser, wherein the at least one transaction function device includes a transaction function device opening, wherein the fascia includes a floating bezel, wherein the floating bezel is movable relative to the fascia and includes a bezel opening therethrough; and

- b) responsive to movement of the fascia in (a), urging the floating bezel to move relative the fascia in at least one direction to align the bezel opening and the transaction function device opening.

35. (new) A method comprising:

- a) moving a fascia of an automated banking machine from an open position to a closed position adjacent a frame of the automated banking machine, wherein the automated banking machine includes a plurality of transaction function devices including a cash dispenser, wherein at least one transaction function device includes a movable portion and a fixed portion relative to the frame, wherein the movable portion includes a transaction function device opening through which items are enabled to pass, wherein the movable portion is operatively engageable with the fascia, and wherein the fascia includes a fascia opening therethrough; and
- b) responsive to operative engagement between the movable portion and the fascia during at least a portion of the movement of the fascia in (a), moving the movable

portion in at least two dimensions with respect to the fixed portion to align the transaction function device opening and the fascia opening.

36. (new) A method comprising:

- a) moving a fascia of an automated banking machine from an open position to a closed position in supporting relation with a frame of the automated banking machine, wherein the automated banking machine includes a plurality of transaction function devices including a cash dispenser, wherein at least one transaction function device includes a transaction function device opening through which items are enabled to pass, wherein the transaction function device opening is movable relative to and in supporting relation with the frame, and wherein the transaction function device including the transaction function device opening includes at least one LED adjacent the transaction function device opening, wherein the fascia includes a fascia opening therethrough, and wherein the fascia opening is movable relative to the fascia, and wherein the fascia includes a light indicator aperture adjacent the fascia opening, wherein a transparent member extends in the light indicator aperture; and

b) responsive to movement of the fascia to the closed position in (a), aligning the transaction function device opening and the fascia opening and aligning the at least one LED and the transparent member, including at least one of:

i) moving the fascia opening relative to the fascia; and

ii) moving the transaction function device opening relative to the frame.

37. (new) A cash dispensing automated banking machine comprising:

at least one frame;

a plurality of transaction function devices including a cash dispenser, wherein the plurality of transaction function devices are each in supporting relation with the at least one frame, wherein a first transaction function device is movably mounted in supporting relation with the at least one frame and includes a transaction function device opening through which at least one of dispensed items and deposited items are enabled to pass;

a fascia movably mounted in supporting relation with the at least one frame, wherein the fascia includes a fascia opening therethrough, wherein the fascia opening is movable relative to the fascia, wherein at least one of the fascia and the first transaction function

device are relatively movable between an adjacent position with respect to each other and a spaced apart position with respect to each other, wherein responsive to the fascia and the first transaction function device being relatively moved from the spaced apart position to the adjacent position, at least one of the first transaction function device is moved such that the transaction function device opening pivots relative to the at least one frame and into alignment with the fascia opening and the fascia opening moves relative to the fascia and into alignment with the transaction function device opening.

38. (new) A method comprising:

- a) relatively moving a fascia and a transaction function device of a cash dispensing automated banking machine, wherein the fascia includes a fascia opening and the device includes a device opening, wherein the fascia opening and the device opening are each adapted to enable at least one of items deposited in the machine and items dispensed from the machine to pass therethrough, wherein the fascia and transaction function device are relatively moved from a first position in which the fascia opening and device opening are not adjacent to one another to a second position in which the fascia opening and device opening are in adjacent aligned relation;
- b) during at least a portion of (a), operatively engaging a structure that is movably mounted in supporting relation with the fascia, which structure includes the

fascia opening, and the transaction function device, and moving the structure including the fascia opening relative to the fascia through such operative engagement such that the fascia opening and device opening are in adjacent aligned relation when the fascia and transaction function device are in the second position.

39. (new) A method comprising:

- a) relatively moving a fascia and a transaction function device of a cash dispensing automated banking machine, wherein the fascia includes a fascia opening and the device includes a device opening, wherein the fascia opening and the device opening are each adapted to enable at least one of items deposited in the machine and items dispensed from the machine to pass therethrough, wherein the fascia and transaction function device are relatively moved from a first position in which the fascia opening and device opening are not adjacent to one another to a second position in which the fascia opening and the device opening are in adjacent aligned relation;
- b) during at least a portion of (a), operatively engaging the fascia and at least a portion of the transaction function device, wherein the portion of the transaction function device is pivotally movably mounted relative to the machine and wherein the portion of the transaction function device that is movable relative to the

machine includes the device opening, and pivotally moving the device opening relative to the machine through such operative engagement of the portion of the transaction function device and the fascia such that the fascia opening and device opening are in adjacent aligned relation when the fascia and transaction function device are in the second position.
